Android Google Services

Part 3

Google Maps

Google Services Overview

- ❑ Overview of **Google Play Services** and Setup
- ❑ Detailed look at
 - Google Sign-in and Authentication (Part 1)
 - Location & Geocoding (Part 2)
 - Google Maps (Part 3)

Google Services Overview

- Detailed look at
 - Google Maps (Part 3)

Agenda

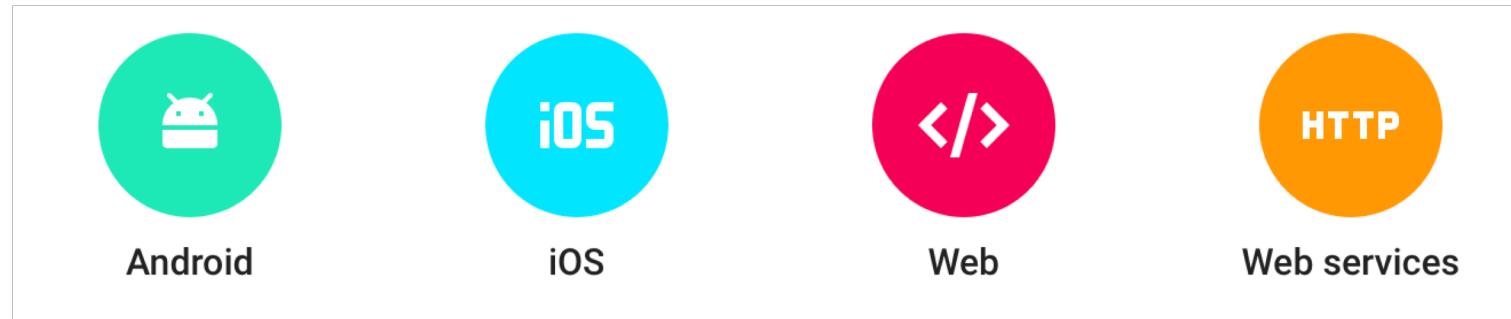

- ❑ Overview
- ❑ Installation & Registration of the Google Maps API ‘Key’
- ❑ Creating interactive Maps with **GoogleMaps**,
(Support)MapFragments & **FragmentActivitiy**s
- ❑ Creating & Adding **Markers** to Maps
- ❑ Custom Styling our Maps (Video)

Overview – What is it?

- ❑ “A mapping and navigation application for desktop and mobile devices from Google. Maps provides turn-by-turn directions to a destination along with 2D and 3D satellite views, as well as public transit information. Maps also offers photographic views of the turns, which show the real streets and surroundings (Google "street views").” – www.pcmag.com

- ❑ **Google Maps APIs** are available for Android, iOS, web browsers and via HTTP web services.

Overview – Accessing Google Maps

❑ Google maps can be accessed in two ways

- Through a browser or a **WebView**
- Through the **Google Maps Android API v2**

❑ Google Maps Android API v2

- allows you to incorporate Google Maps into applications
- is distributed as part of the Google Play Services SDK
- encapsulates maps in a **MapFragment** or a **SupportMapFragment**

MapFragment and **SupportMapFragment** essentially replace the **MapActivity** class used in version 1.

Overview – Usage *

□ Using Google Maps Android API v2, you can

- Add maps to your app
 - 3D maps, Terrain maps, Satellite maps.
- Customize the map
 - Markers, Image Overlays, Polylines/Polygons
- Control the user's view
 - Zoom, Pan, Rotate
- Apply Custom Styles
 - Day/Night view, Custom Colours, Look & Feel.

Aside - Attribution Requirements

If you use the Google Maps Android API in your application, you must include the Google Play Services attribution text as part of a “Legal Notices” section in your application. Including legal notices as an independent menu item, or as part of an “About” menu item, is recommended.

The attribution text is available by making a call to method
`GooglePlayServicesUtil.getOpenSourceSoftwareLicenseInfo()`
and you should probably use a `WebView` not a `TextView`!

Part 3

Google Maps Android API

Introduction

- ❑ With the Google Maps Android API, you can add maps based on Google Maps data to your application.
- ❑ The API automatically handles access to Google Maps servers, data downloading, map display, and response to map gestures.
- ❑ You can also use API calls to add markers, polygons, and overlays to a basic map, and to change the user's view of a particular map area.
- ❑ These objects provide additional information for map locations, and allow user interaction with the map.

Introduction

- The API allows you to add these graphics to a map:
 - Icons anchored to specific positions on the map (**Markers**).
 - Sets of line segments (**Polylines**).
 - Enclosed segments (**Polygons**).
 - Bitmap graphics anchored to specific positions on the map (**Ground Overlays**).
 - Sets of images which are displayed on top of the base map tiles (**Tile Overlays**).

Google Maps API Requirements

- For integrating Google Maps into your Android Application, you need to complete the following :
 1. Enable Google Maps API on [The Developers Console](#) and create credentials for your application authentication
 2. Configuring Google Play Services in Android Studio
 3. Create your Android Application with Google Maps integration

1. Enable Google Maps API *

- ① You can take the same approach as we did for enabling the Google Sign-In OR you can let Google guide you through the process (as follows)

Visit [Get API Key](#) and follow the instructions (as per dev docs)

Step 1. Get an API key

Click the button below, to get an API key using the Google Cloud Platform Console. You will be asked to (1) pick one or more products, (2) select or create a project, and (3) set up a billing account. Once your API key is created you will be prompted to restrict the key's usage. (For more information, see [Restricting an API key](#).)

[GET STARTED](#)

1. Enable Google Maps API *

The screenshot shows a web browser window for the Google Cloud Platform Google Maps Platform. The URL is `cloud.google.com/maps-platform/?_utma=102347093.90`. The page title is "Enable Google Maps Platform". It contains instructions: "To enable APIs or set up billing, we'll guide you through a few tasks:" followed by a numbered list: 1. Pick product(s) below, 2. Select a project, 3. Set up your billing. There are three checkboxes: Maps (selected), Routes, and Places. Below each checkbox is a brief description. At the bottom are "CANCEL" and "CONTINUE" buttons. The background features a city skyline at night.

Enable Google Maps Platform

To enable APIs or set up billing, we'll guide you through a few tasks:

1. Pick product(s) below
2. Select a project
3. Set up your billing

Maps
Build customized map experiences that bring the real world to your users.

Routes
Give your users the best way to get from A to Z.

Places
Help users discover the world with rich details.

CANCEL CONTINUE

1. Enable Google Maps API *

The screenshot shows a web browser window with the URL cloud.google.com/maps-platform/?apis=maps. The page title is "Enable Google Maps Platform".
The main content area contains:

- To enable APIs or set up billing, we'll guide you through a few tasks:
- 1. Pick product(s) below
- 2. Select a project
- 3. Set up your billing

Three checkboxes are shown:

- Maps**: Build customized map experiences that bring the real world to your users.
- Routes**: Give your users the best way to get from A to Z.
- Places**: Help users discover the world with rich details.

At the bottom right are "CANCEL" and "CONTINUE" buttons.

1. Enable Google Maps API *

A screenshot of a web browser window showing the Google Cloud Platform interface for enabling the Google Maps Platform. The main background page is titled 'Google Maps Platform' and features a city skyline at night with a 'Welcome to Google' banner. A modal dialog box is overlaid on the screen, titled 'Enable Google Maps Platform'. Inside the dialog, there's a section titled 'Steps to get started' with three numbered steps: 1. Pick a product, 2. Select a project, and 3. Set up your billing. A dropdown menu labeled 'CoffeeMate Project' is highlighted with a red border and a black arrow pointing to it from the left side of the image. At the bottom of the dialog, there are 'CANCEL' and 'NEXT' buttons.

1. Enable Google Maps API *

A screenshot of a web browser window showing the Google Maps Platform Billing console. The URL in the address bar is `console.cloud.google.com/billing/enable?consoleReturnUrl=https:%`. The page title is "Google Maps Platform" and the sub-section is "Billing". A message at the top says "Enabling billing on Maps API console...". A modal dialog box is centered on the screen with the title "Enable billing for project 'CoffeeMate Project'". The dialog contains the text: "You are not an administrator of any billing accounts. To enable billing on this project, create a new billing account or contact your billing account administrator to enable billing for you. [Learn more](#)". At the bottom of the dialog are two buttons: "CANCEL" and "CREATE BILLING ACCOUNT". The "CREATE BILLING ACCOUNT" button is highlighted with a red rectangle and has a black arrow pointing to it from the right side of the image.

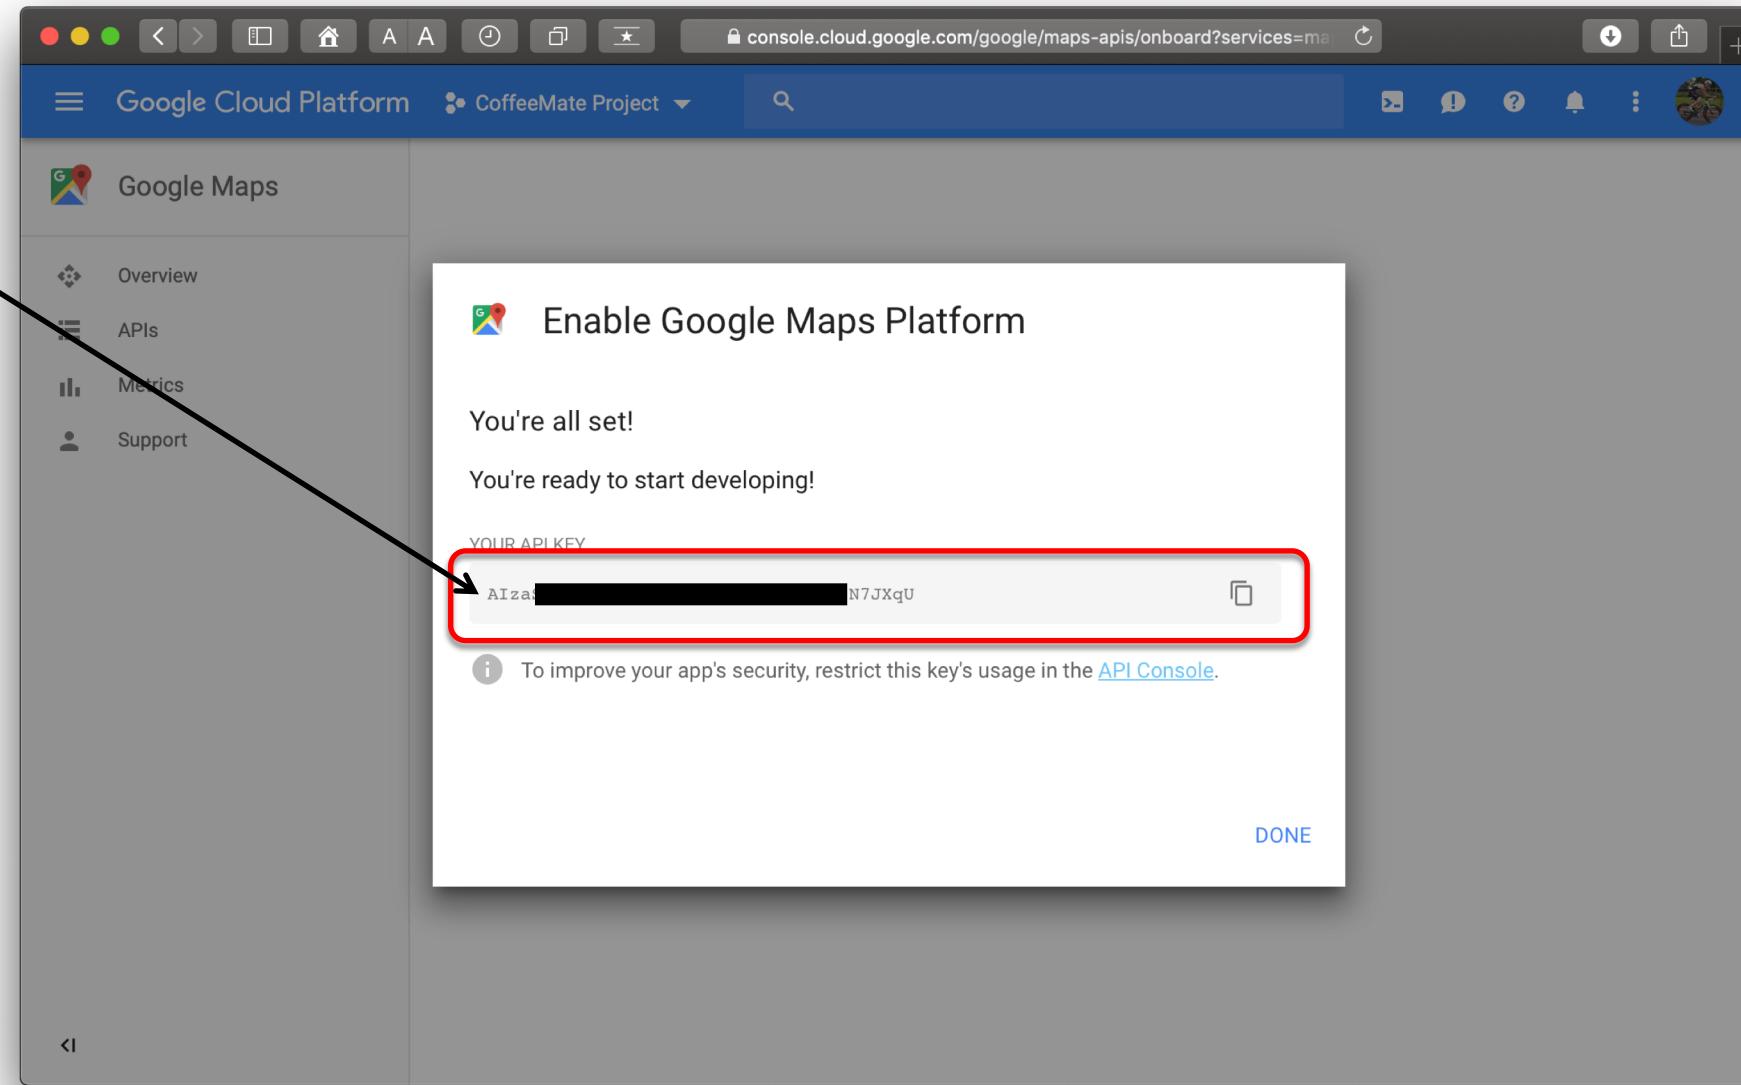

1. Enable Google Maps API *

A screenshot of the Google Cloud Platform console. The URL in the address bar is `console.cloud.google.com/google/maps-apis/onboard?services=ma`. The sidebar on the left shows the 'Google Maps' project with options: Overview, APIs, Metrics, and Support. A black arrow points from the text 'Enable your APIs' in the dialog box to the 'APIs' link in the sidebar. The main content area displays a modal dialog titled 'Enable Google Maps Platform'. The dialog contains the text: 'Enable your APIs' and 'This will enable 7 Google Maps Platform API(s) and create an API key for your implementation.' At the bottom of the dialog are 'CANCEL' and 'NEXT' buttons. The entire dialog is highlighted with a red rounded rectangle.

1. Enable Google Maps API *

A screenshot of a web browser window showing the Google Cloud Platform Google Maps API enablement dialog. The dialog box is titled "Enable Google Maps Platform" and contains the message "You're all set! You're ready to start developing!". Below this, there is a section labeled "YOUR API KEY" containing a redacted API key value: "AIza[REDACTED]N7JXqU". A red rectangle highlights this key value, and a black arrow points from the left edge of the image towards it. At the bottom of the dialog, there is a note: "To improve your app's security, restrict this key's usage in the [API Console](#)." A "DONE" button is at the bottom right. The background shows the Google Cloud Platform interface with the "Google Maps" service selected in the sidebar.

1. Enable Google Maps API *

Application restrictions: Android apps API restrictions: None

[Application restrictions](#) [API restrictions](#)

Application restrictions specify which web sites, IP addresses or apps can use this key. You can set one restriction type per key.

Application restrictions

None
 HTTP referrers (websites)
 IP addresses (web servers, cron jobs, etc.)
 Android apps
 iOS apps

Restrict usage to your Android apps (Optional)

Add your package name and SHA-1 signing-certificate fingerprint to restrict usage to your Android apps
Get the package name from your AndroidManifest.xml file. Then use the following command to get the fingerprint:

```
$ keytool -list -v -keystore mystore.keystore
```

Package name	SHA-1 certificate fingerprint
ie.cm	AA:F[REDACTED]:79:E3:C6

[+ Add package name and fingerprint](#)

Note: It may take up to 5 minutes for settings to take effect.

[Save](#) [Cancel](#)

1. Enable Google Maps API *

The screenshot shows the Google Cloud Platform API key settings page for a Google Maps API key. The URL in the browser is `console.cloud.google.com/apis/credentials/key/185ba235-94a2-4ea...`. The page title is "Google Maps - CoffeeMate Project - Google Cloud Plat...". The main heading is "API key" with options to "REGENERATE KEY" or "DELETE". Below this, it says "Application restrictions: Android apps" and "API restrictions: None". A tab labeled "Application restrictions" is selected. The instructions state: "Application restrictions specify which web sites, IP addresses or apps can use this key. You can set one restriction type per key." Under "Application restrictions", the "Android apps" option is selected. A section titled "Restrict usage to your Android apps (Optional)" provides instructions on how to get the package name and SHA-1 certificate fingerprint from an AndroidManifest.xml file. It includes a command-line example: `$ keytool -list -v -keystore mystore.keystore`. A table shows existing restrictions: one entry for "com.example" with the SHA-1 fingerprint "12:34:56:78:90:AB:CD:EF:12:34:56:78:90:AB:CD:EF:AA:BB:CC:DD". A red box highlights this table. A note at the bottom says: "Note: It may take up to 5 minutes for settings to take effect."

1. Enable Google Maps API *

The screenshot shows the Google Cloud Platform Credentials page for the 'CoffeeMate Project'. The 'Credentials' tab is selected. A red box highlights the first API key in the list, which is 'CoffeeMate 04.12.18 API key'. A black arrow points to this highlighted row from the left side of the screen.

Name	Creation date	Restrictions	Key	Action
CoffeeMate 04.12.18 API key	4 Dec 2018	Android apps	Alza [REDACTED] XqU	
Browser key (auto created by Google Service)	30 Jun 2017	HTTP referrers	Alza [REDACTED] _QQ	
CoffeeMate 2018 / 2019	30 Jun 2017	Android apps	Alza [REDACTED] OWg	
Server key (auto created by Google Service)	30 Jun 2017	IP addresses	Alza [REDACTED] 3A	
CoffeeMate API key	8 Nov 2016	Android apps	Alza [REDACTED] n1pY	
Android key 1	6 Dec 2013	Android apps	Alza [REDACTED] dpE	

1. Enable Google Maps API *

Step 2. Add the API key to your app

Follow the steps below to include the API key in your application's manifest, contained in the file `AndroidManifest.xml`.

1. In `AndroidManifest.xml`, add the following element as a child of the `<application>` element, by inserting it just before the closing `</application>` tag:

```
<meta-data  
    android:name="com.google.android.geo.API_KEY"  
    android:value="YOUR_API_KEY" />
```

Substitute your API key for `YOUR_API_KEY` in the `value` attribute. This element sets the key `com.google.android.geo.API_KEY` to the value of your API key.

2. Save `AndroidManifest.xml` and re-build your application.

2. Configure Google Play Services

Already Done! (should be, from previous slides...)

3. Create your Android App (CoffeeMate)

- You'll cover this in the Labs, but we'll have a look at some of the setup and code next

Integrating Google Maps into Your Android App

<https://developers.google.com/maps/documentation/android-api/>

<https://code.tutsplus.com/series/getting-started-with-google-maps-for-android--cms-891>

1. Setting Up Your Android Project *

- ☐ First thing to do (after you've got your API Key) is to open your **build.gradle** file and confirm/import the Play Services library for maps and the locations Play Services library in order to set an initial position for your map. Place the following lines into the dependencies node of the **build.gradle** file. (version numbers may differ, currently 16)

```
implementation 'com.google.android.gms:play-services-maps:15.0.1'  
implementation 'com.google.android.gms:play-services-location:15.0.1'
```

1. Setting Up Your Android Project *

- Next, open your **AndroidManifest.xml** file. Above the **<application>** node, you need to define the permissions needed by your application.

```
<uses-permission android:name="android.permission.INTERNET" />
<uses-permission android:name="ie.cm.permission.MAPS_RECEIVE" />
<uses-permission android:name="android.permission.ACCESS_FINE_LOCATION" />
```

1. Setting Up Your Android Project *

- Then, within the <application> node, add one piece of metadata. This binds the Maps API key with your application (@string/google_maps_key).

```
<meta-data  
    android:name="com.google.android.geo.API_KEY"  
    android:value="@string/google_maps_key" />
```

1. Setup - Creating your Map Class

- ❑ You'll need to create a new class (your class `MapFragment`), which extends `SupportMapFragment`
 - used here rather than `com.google.android.gms.maps.MapFragment` for backwards compatibility & is deprecated in Android 28 (Pie).

And implement the following interfaces (next slide for expl.)

```
public class MapFragment extends SupportMapFragment implements  
    GoogleApiClient.ConnectionCallbacks,  
    GoogleApiClient.OnConnectionFailedListener,  
    GoogleMap.OnInfoWindowClickListener,  
    GoogleMap.OnMapLongClickListener,  
    GoogleMap.OnMapClickListener,  
    GoogleMap.OnMarkerClickListener {
```

1. Setup - The Necessary interfaces

- `ConnectionCallbacks` and `OnConnectionFailedListener` are designed to monitor the state of the `GoogleApiClient`, which is used in this application for getting the user's current location.
- `OnInfoWindowClickListener` is triggered when the user clicks on the info window that pops up over a marker on the map.
- `OnMapLongClickListener` and `OnMapClickListener` are triggered when the user either taps or holds down on a portion of the map.
- `OnMarkerClickListener` is called when the user clicks on a marker on the map, which typically also displays the info window for that marker.

1. Setup - Updating the Layout

- Once you have the initial fragment built, you need to let your **MainActivity** (or wherever you plan on displaying the map) know that it should use this fragment. Open your **xml layout** from your resources folder and change it so that it includes the fragment as a view.

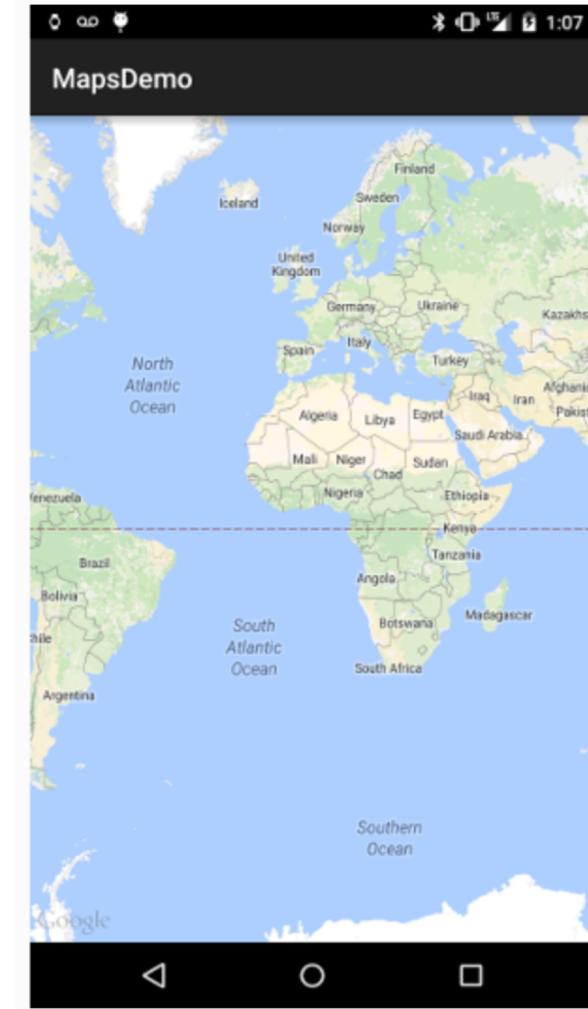

```
<RelativeLayout xmlns:android="http://schemas.android.com/apk/res/android"  
    xmlns:tools="http://schemas.android.com/tools" android:layout_width="match_parent"  
    android:layout_height="match_parent"  
    tools:context=".MainActivity">  
  
    <fragment  
        android:id="@+id/map"  
        android:name="com.tutsplus.mapsdemo.MapFragment"  
        android:layout_width="match_parent"  
        android:layout_height="match_parent"/>  
  
</RelativeLayout>
```

- You'll use your own class reference

1. Test the Setup

- ❑ After updating your activity layout, you should be able to run your application and view a map of Earth that is fully zoomed out and focused on latitude 0, longitude 0.

2. Initializing the Map - Declaring Map Types *

- Returning to our **MapFragment** class, you need to define some global values at the top of the class for use in your application.

```
private GoogleApiClient mGoogleApiClient;
private Location mCurrentLocation;

private final int[] MAP_TYPES = { GoogleMap.MAP_TYPE_SATELLITE,
    GoogleMap.MAP_TYPE_NORMAL,
    GoogleMap.MAP_TYPE_HYBRID,
    GoogleMap.MAP_TYPE_TERRAIN,
    GoogleMap.MAP_TYPE_NONE };

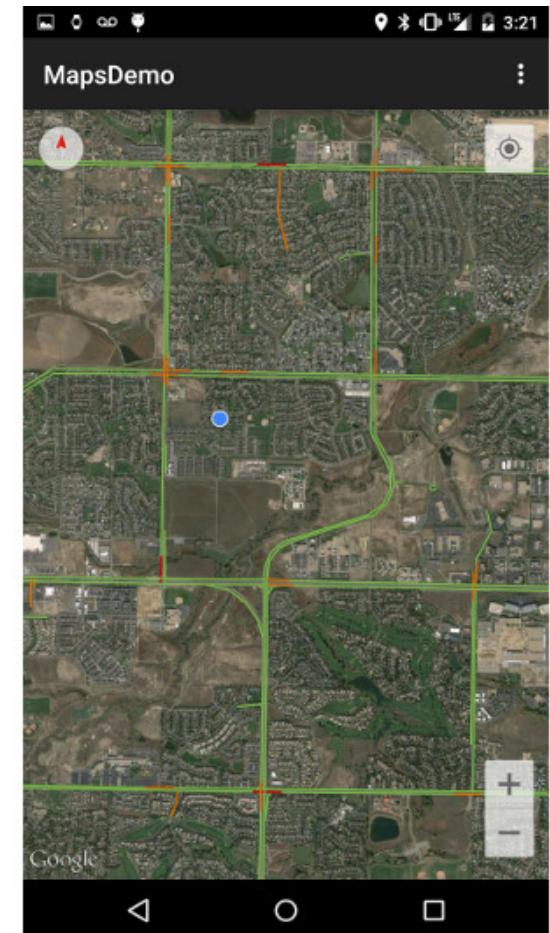

private int curMapTypeIndex = 0;
```

- Each of the map types serves a different purpose, so one or more may be suitable for your own applications.

2. Initializing the Map - Declaring Map Types *

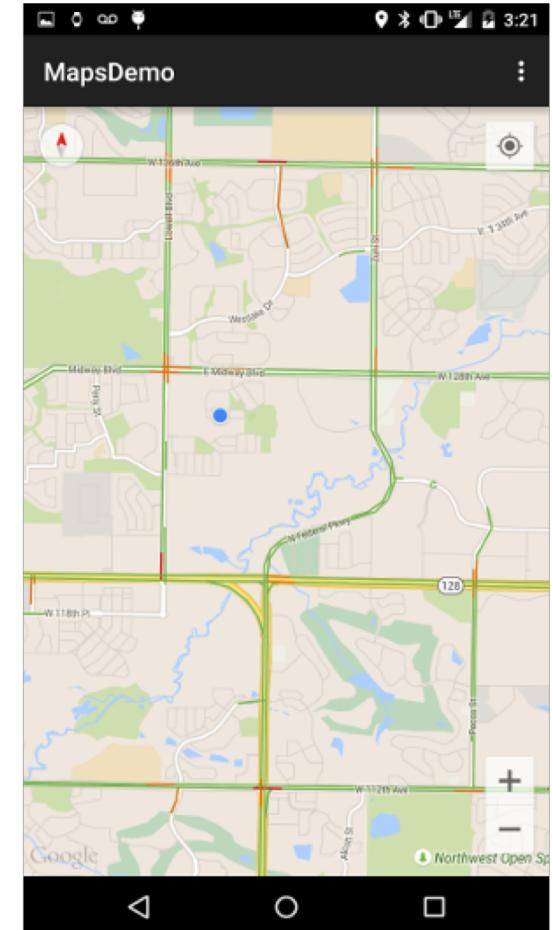

- ❑ `GoogleMap.MAP_TYPE_SATELLITE` displays a satellite view of the area without street names or labels.

2. Initializing the Map - Declaring Map Types *

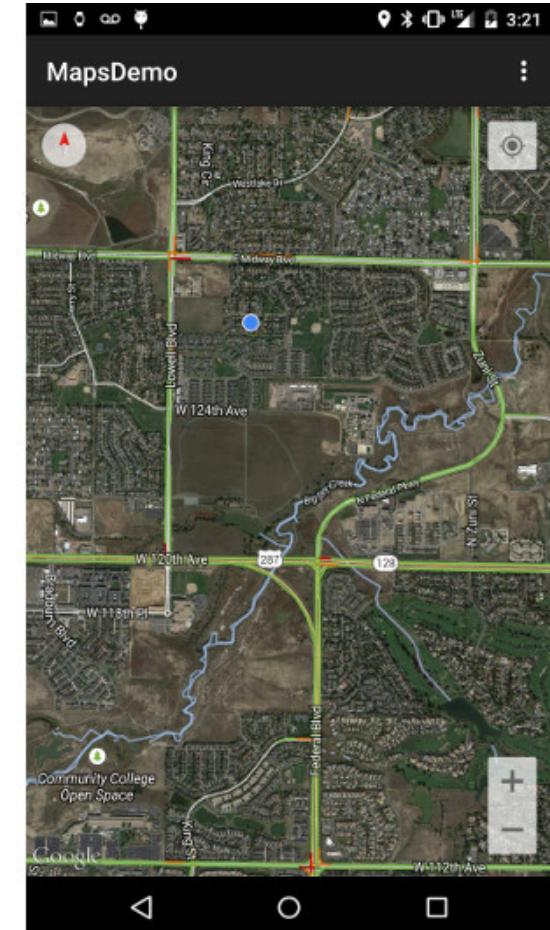

- ❑ `GoogleMap.MAP_TYPE_Normal` shows a generic map with street names and labels.

2. Initializing the Map - Declaring Map Types *

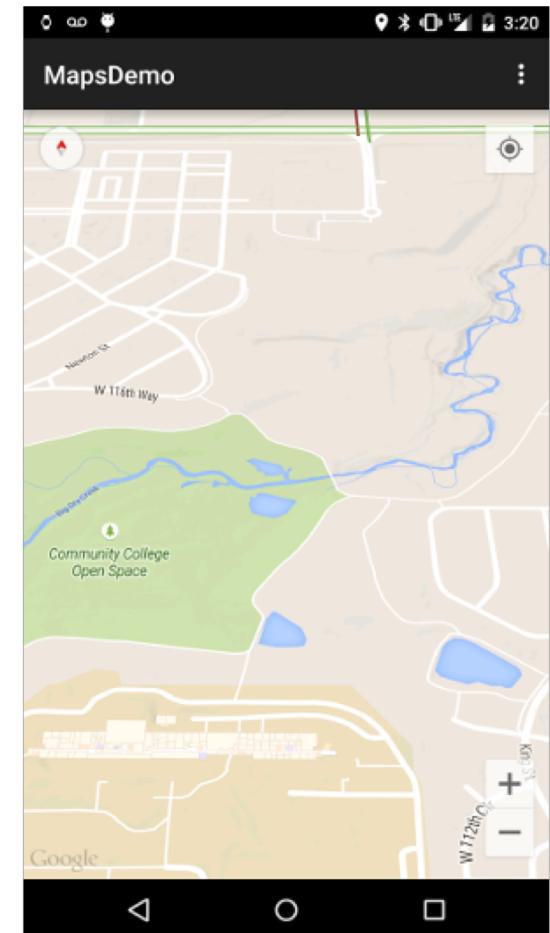

- ❑ `GoogleMap.MAP_TYPE_HYBRID` combines satellite and normal mode, displaying satellite images of an area with all labels.

2. Initializing the Map - Declaring Map Types *

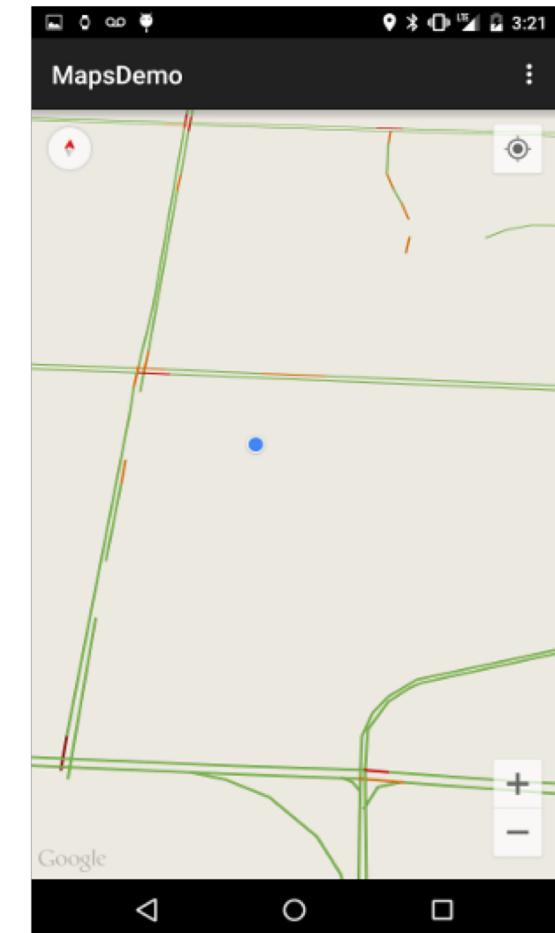

- ❑ `GoogleMap.MAP_TYPE_TERRAIN` is similar to a normal map, but textures are added to display changes in elevation in the environment. These textures are most visible when the map is angled with a two-finger drag.

2. Initializing the Map - Declaring Map Types *

- ❑ `GoogleMap.MAP_TYPE_NONE` is similar to a normal map, but doesn't display any labels or coloration for the type of environment in an area. It does allow for displaying traffic and other overlays on the map.

2. Initializing the Map – Creating the API Client *

- ❑ Create your **GoogleApiClient** and initiate **LocationServices** to get your user's current location.

```
@Override  
public void onViewCreated(View view, Bundle savedInstanceState) {  
    super.onViewCreated(view, savedInstanceState);  
  
    setHasOptionsMenu(true);  
  
    mGoogleApiClient = new GoogleApiClient.Builder( getActivity() )  
        .addConnectionCallbacks( this )  
        .addOnConnectionFailedListener( this )  
        .addApi( LocationServices.API )  
        .build();  
  
    initListeners();  
}
```

2. Initializing the Map – Creating the API Client

- ❑ The `initListeners` method binds the interfaces that you declared at the top of the class with the `GoogleMap` object associated with `SupportMapFragment`.

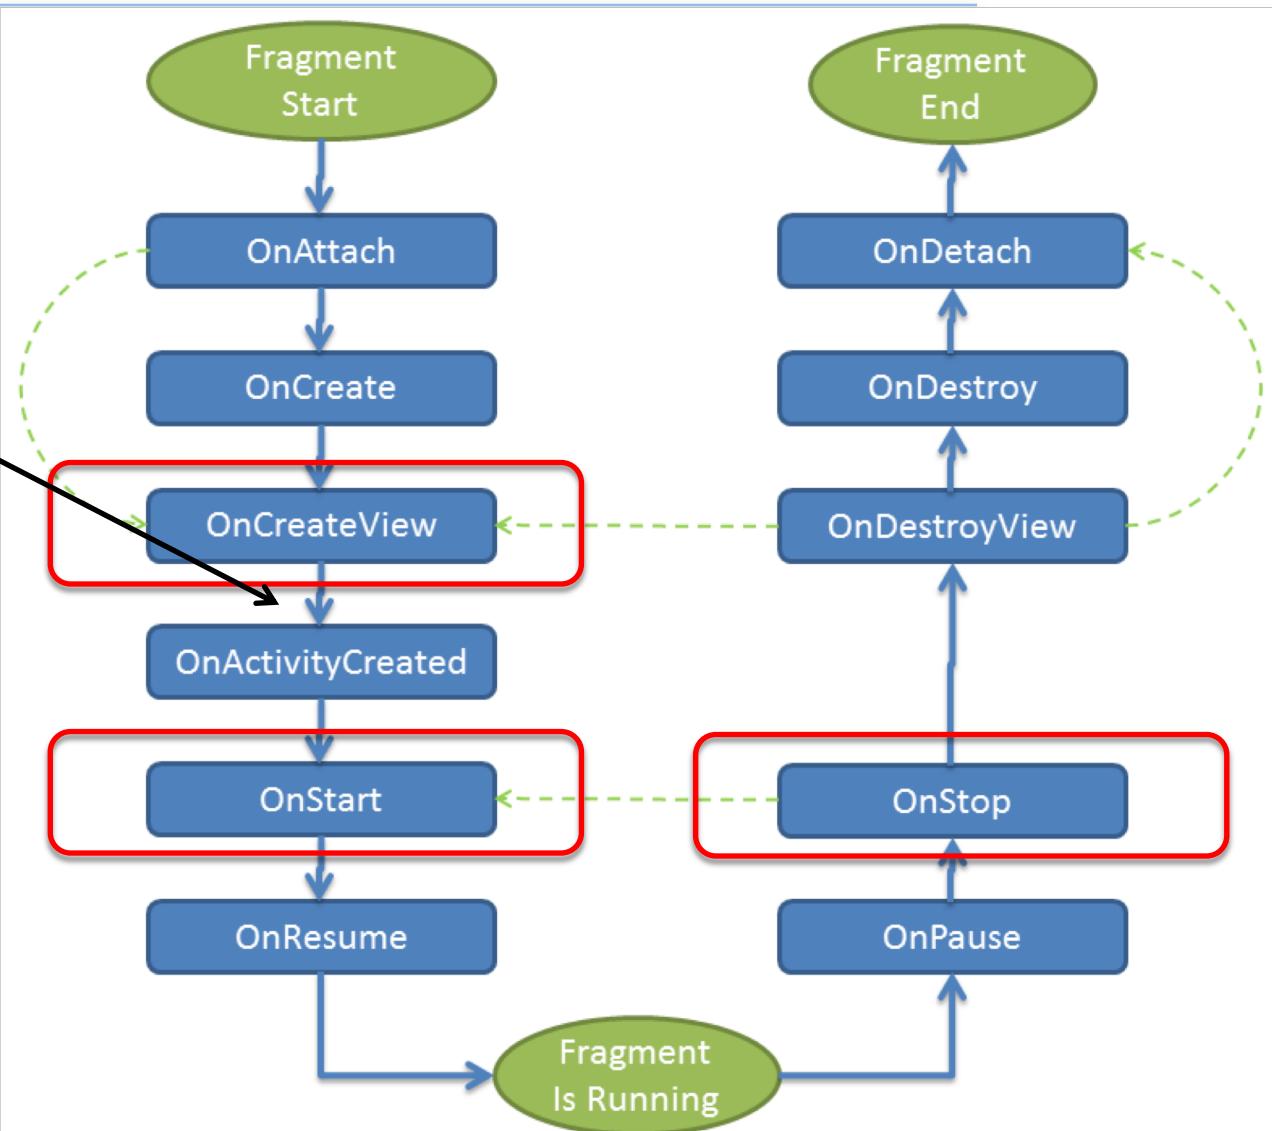

```
private void initListeners() {  
    getMap().setOnMarkerClickListener(this);  
    getMap().setOnMapLongClickListener(this);  
    getMap().setOnInfoWindowClickListener( this );  
    getMap().setOnMapClickListener(this);  
}
```

- ❑ Note: the `GoogleApiClient` and listeners are created and bound from `onViewCreated` rather than the typical `onCreate`. The `GoogleMap` object has not been initialized when `onCreate` is called - need to wait until the view is fully created before trying to call `getMap` in order to avoid a `NullPointerException` – `getMapAsync()` supersedes this.

Recap - Fragment Lifecycle *

- ❑ `OnViewCreated()` is called here
- ❑ Immediately after `OnCreateView()`

2. Initializing the Map – Configuring the Map *

- Connect the **GoogleApiClient** in **onStart**.

```
@Override  
public void onStart() {  
    super.onStart();  
    mGoogleApiClient.connect();  
}  
  
@Override  
public void onStop() {  
    super.onStop();  
    if( mGoogleApiClient != null && mGoogleApiClient.isConnected() ) {  
        mGoogleApiClient.disconnect();  
    }  
}
```

2. Initializing the Map – Configuring the Map *

- Once connected, you can grab the user's most recently retrieved location and use that for aiming the map camera.

```
@Override  
public void onConnected(Bundle bundle) {  
    mCurrentLocation = LocationServices  
        .FusedLocationApi  
        .getLastLocation( mGoogleApiClient );  
  
    initCamera( mCurrentLocation );  
}
```

2. Initializing the Map – Configuring the Map *

- Once connected, you can grab the user's most recently retrieved location and use that for aiming the map camera.

```
private void initCamera( Location location ) {  
    CameraPosition position = CameraPosition.builder()  
        .target( new LatLng( location.getLatitude(),  
            location.getLongitude() ) )  
        .zoom( 16f )  
        .bearing( 0.0f )  
        .tilt( 0.0f )  
        .build();  
  
    getMap().animateCamera( CameraUpdateFactory  
        .newCameraPosition( position ), null );  
  
    getMap().setMapType( MAP_TYPES[curMapTypeIndex] );  
    getMap().setTrafficEnabled( true );  
    getMap().setMyLocationEnabled( true );  
    getMap().getUiSettings().setZoomControlsEnabled( true );  
}
```

3. Marking Locations *

- ❑ One of the most used map features involves indicating locations with markers. Since a latitude and longitude are needed for adding a marker, use the **OnMapClickListener** to allow the user to pick a spot on the map to place a **Marker** object.

```
@Override  
public void onMapClick(LatLng latLng) {  
  
    MarkerOptions options = new MarkerOptions().position( latLng );  
    options.title( getAddressFromLatLng( latLng ) );  
  
    options.icon( BitmapDescriptorFactory.defaultMarker() );  
    getMap().addMarker( options );  
}
```

- ❑ This method creates a generic red marker where the user has tapped.

3. Marking Locations *

- ☐ If you want to avoid using the generic colored pins for your location markers, or setting a marker as draggable you can set those options via the **MarkerOptions** object.

```
MarkerOptions options = new MarkerOptions().position( lngLat );  
options.title( getAddressFromLatLang( lngLat ) );  
  
options.icon( BitmapDescriptorFactory.fromBitmap(  
    BitmapFactory.decodeResource( getResources(),  
        R.mipmap.ic_launcher ) ) );  
  
getMap().addMarker( options );
```

3. Marking Locations *

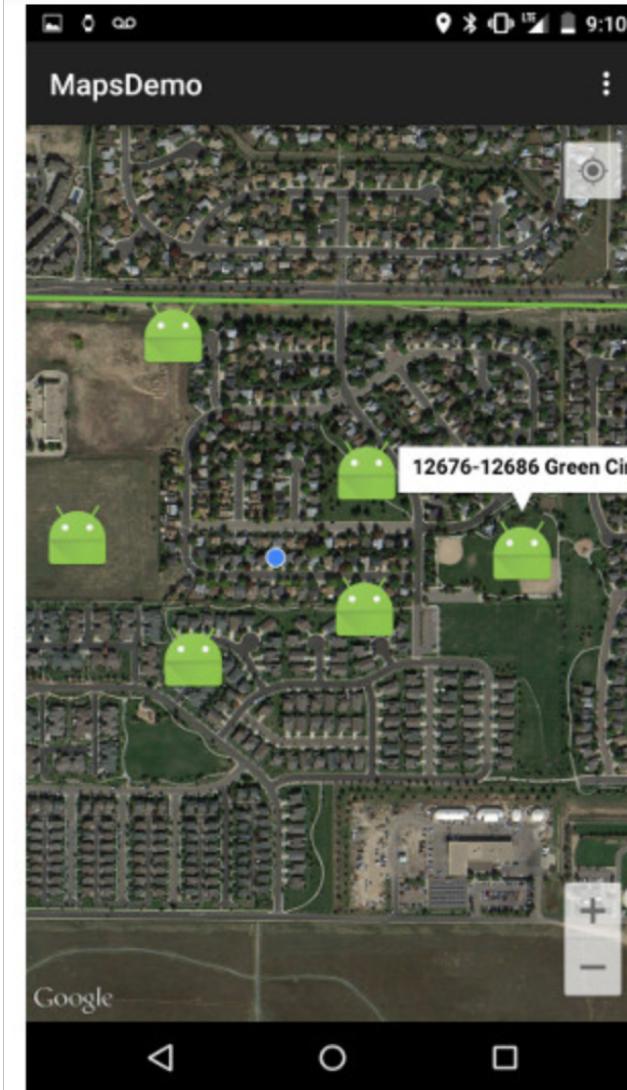

- The `getAddressFromLatLng` method is being used in both click methods. This is a helper method that takes a `LatLng` and runs it through a `Geocoder` to get a street address.

```
private String getAddressFromLatLng( LatLng latLng ) {  
    Geocoder geocoder = new Geocoder( getActivity() );  
  
    String address = "";  
    try {  
        address = geocoder  
            .getFromLocation( latLng.latitude, latLng.longitude, 1 )  
            .get( 0 ).getAddressLine( 0 );  
    } catch (IOException e) {  
    }  
  
    return address;  
}  
  
@Override  
public boolean onMarkerClick(Marker marker) {  
    marker.showInfoWindow();  
    return true;  
}
```

3. Marking Locations

- The previous few slides would give us something like this on a map

4. Drawing on the Map

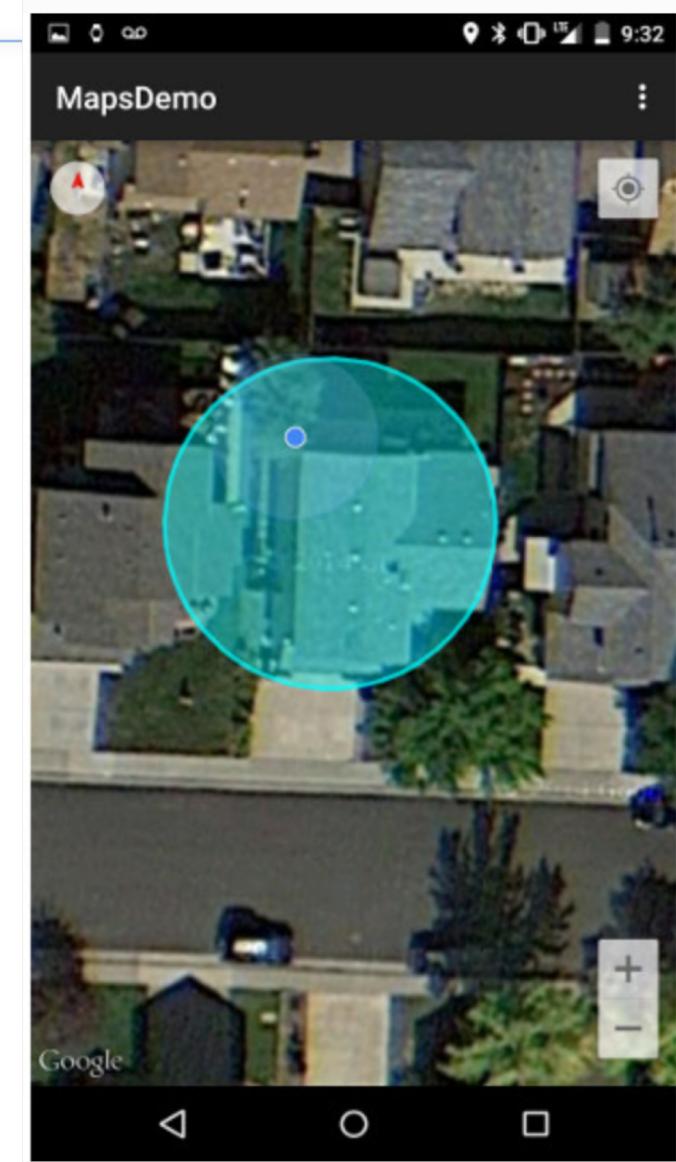

- ❑ The **GoogleMap** object has a set of methods that make it easy to draw shapes and place images onto the map.
- ❑ To draw a simple circle, you only need to create a **CircleOptions** object, set a radius and center location, and define the stroke/fill colors and size.
- ❑ Once you have a **CircleOptions** object, you can call **addCircle** to draw the defined circle on top of the map.
- ❑ Just like when placing markers, objects that are drawn on the map return an object of the drawn item type so it can be referenced later if needed.

4. Drawing on the Map

❑ A `drawCircle` helper method

```
private void drawCircle( LatLng location ) {  
    CircleOptions options = new CircleOptions();  
    options.center( location );  
    //Radius in meters  
    options.radius( 10 );  
    options.fillColor( getResources()  
        .getColor( R.color.fill_color ) );  
    options.strokeColor( getResources()  
        .getColor( R.color.stroke_color ) );  
    options.strokeWidth( 10 );  
    getMap().addCircle(options);  
}
```

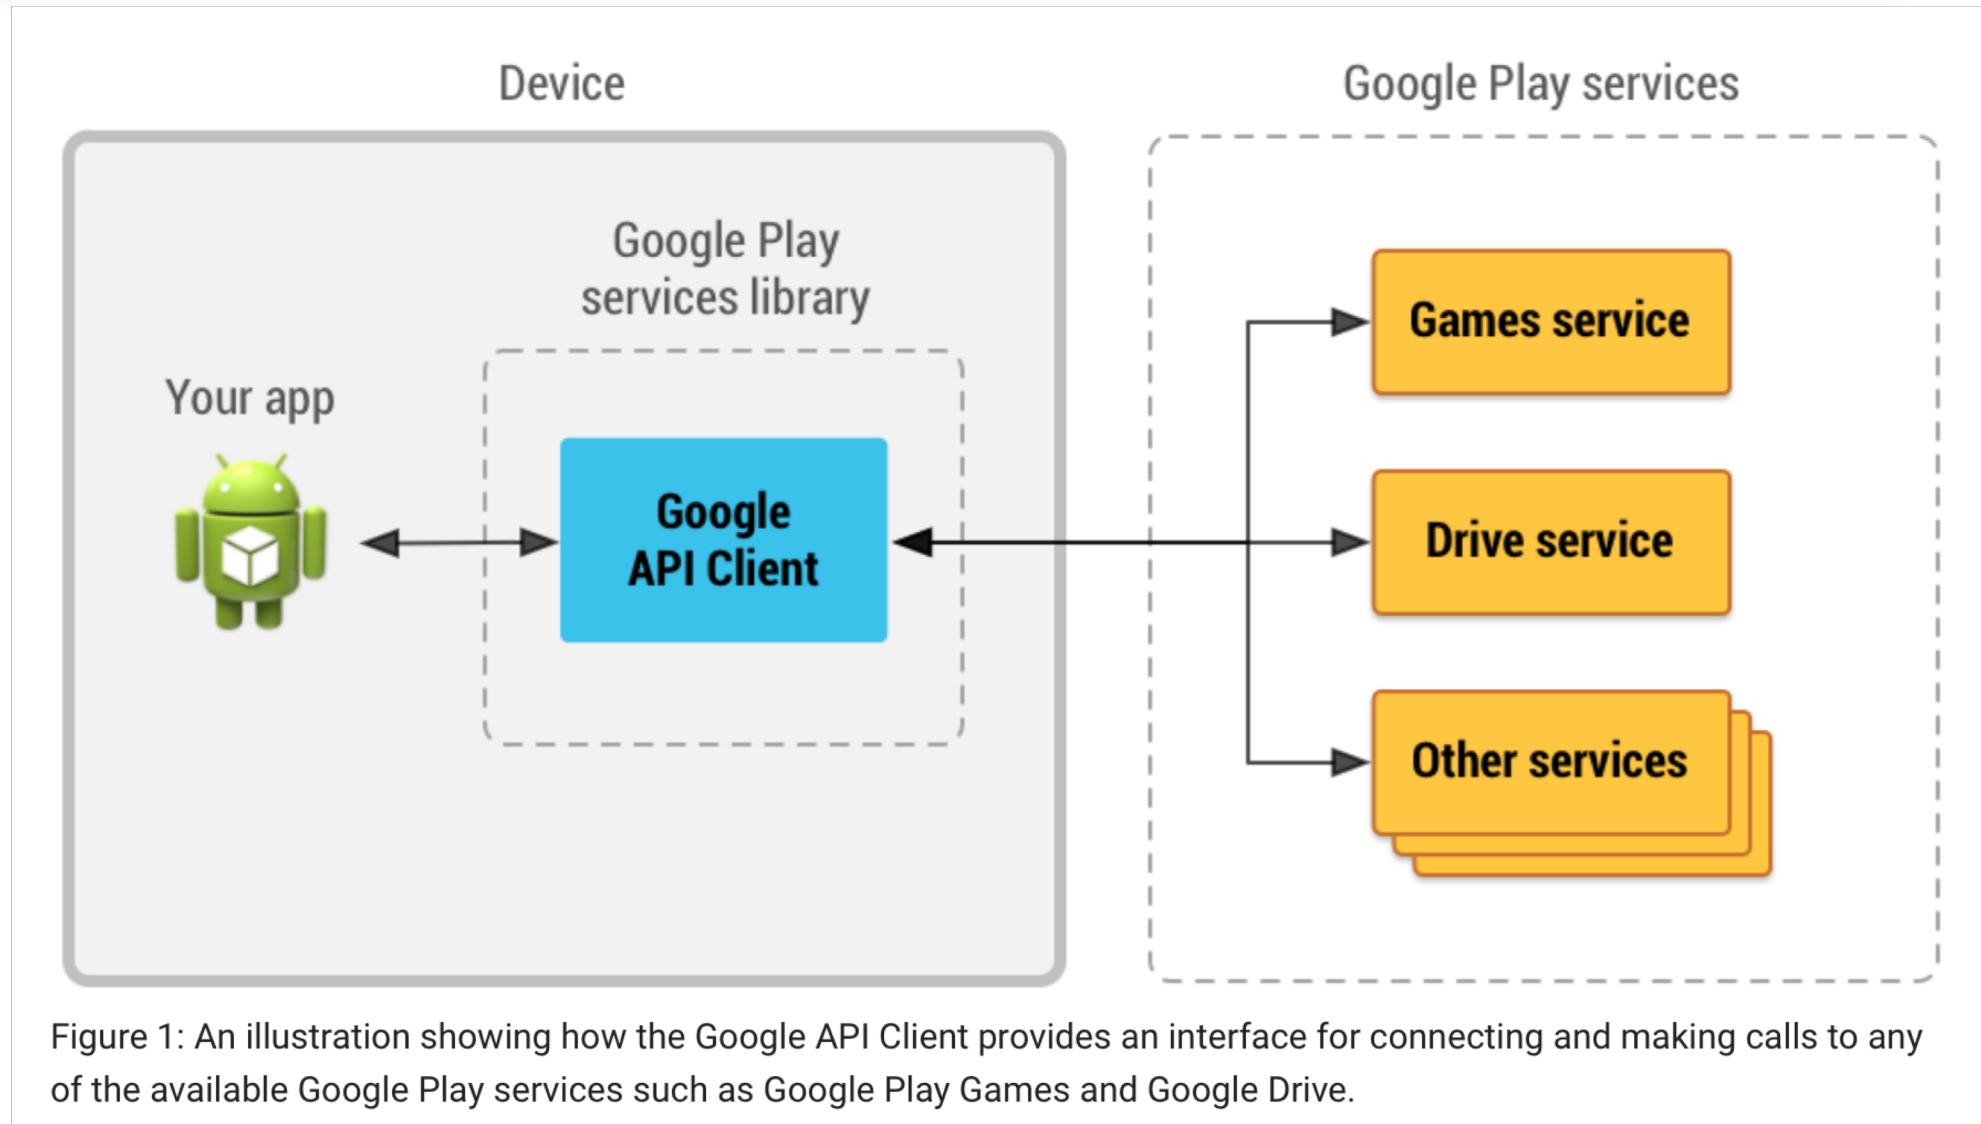

5. Styling your Map

CoffeeMate 8.0

Code Highlights

activity_map layout * (What you'll do initially in the labs)

```
<?xml version="1.0" encoding="utf-8"?>
<RelativeLayout xmlns:android="http://schemas.android.com/apk/res/android"
    xmlns:tools="http://schemas.android.com/tools"
    android:layout_width="match_parent"
    android:layout_height="match_parent"
    android:paddingBottom="6dp"
    android:paddingLeft="64dp"
    android:paddingRight="64dp"
    android:paddingTop="6dp"
    tools:context=".activities.Map">

    <fragment
        android:name="com.google.android.gms.maps.MapFragment"
        android:id="@+id/map"
        android:layout_width="match_parent"
        android:layout_height="match_parent"/>

</RelativeLayout>
```

- Here we declare the **MapFragment** element within our layout.
- Note the resource id.
- Our **Map** Activity.

```
public class Map extends AppCompatActivity {

    @Override
    protected void onCreate(Bundle savedInstanceState) {
        super.onCreate(savedInstanceState);
        setContentView(R.layout.fragment_map);
    }
}
```

manifest file *

```
<?xml version="1.0" encoding="utf-8"?>
<manifest xmlns:android="http://schemas.android.com/apk/res/android"
    package="ie.cm">

    <uses-permission android:name="android.permission.INTERNET" />
    <uses-permission android:name="ie.cm.permission.MAPS_RECEIVE" />
    <uses-permission android:name="android.permission.ACCESS_FINE_LOCATION" />

    <!-- To auto-complete the email text field in the login form with the user
    <uses-permission android:name="android.permission.GET_ACCOUNTS" />
    <uses-permission android:name="android.permission.READ_PROFILE" />
    <uses-permission android:name="android.permission.READ_CONTACTS" />

    <application
        android:name=".main.CoffeeMateApp"
        android:allowBackup="true"
        android:icon="@mipmap/ic_launcher"
        android:label="CoffeeMate.8.0"
        android:supportsRtl="true"
        android:theme="@style/AppTheme"
        android:usesCleartextTraffic="true">
        <activity...>
        <activity...>
        <activity...>

        <meta-data
            android:name="com.google.android.geo.API_KEY"
            android:value="@string/google_maps_key" />

        <activity android:name=".activities.Map"></activity>

        <uses-library android:name="org.apache.http.legacy"
            android:required="false"/>
    </application>

</manifest>
```

- Setting the necessary permissions
- Our Google API Key reference

MapsFragment – interfaces/instance variables *

```
public class MapsFragment extends SupportMapFragment implements
    GoogleMap.OnInfoWindowClickListener,
    GoogleMap.OnMapClickListener,
    GoogleMap.OnMarkerClickListener,
    OnMapReadyCallback,
    VolleyListener {

    private LocationRequest mLocationRequest;
    private FusedLocationProviderClient mFusedLocationClient;
    private LocationCallback mLocationCallback;
    private long UPDATE_INTERVAL = 5000; /* 5 secs
    private long FASTEST_INTERVAL = 1000; /* 1 sec
    private GoogleMap mMap;
    private float zoom = 13f;
    public CoffeeMateApp app = CoffeeMateApp.getInstance();

    private static final int PERMISSION_REQUEST_CODE = 200;

    private final int[] MAP_TYPES = {
        GoogleMap.MAP_TYPE_SATELLITE,
        GoogleMap.MAP_TYPE_NORMAL,
        GoogleMap.MAP_TYPE_HYBRID,
        GoogleMap.MAP_TYPE_TERRAIN,
        GoogleMap.MAP_TYPE_NONE
    };
}
```

- ❑ Here we declare the interfaces our custom **Map Fragment** (**MapsFragment**) implements.
- ❑ Interfaces for **Volley** & Location Updates/Callbacks.
- ❑ Variables to keep track of location requests, the map etc.

GoogleApiClient Setup *

```
// [START build_client]
// Build a GoogleApiClient with access to the Google Sign-In API and the
// options specified by mGoogleSignInOptions.
app.mGoogleApiClient = new GoogleApiClient.Builder(this)
    .enableAutoManage(this /* FragmentActivity */,
                      this /* OnConnectionFailedListener */)
    .addApi(Auth.GOOGLE_SIGN_IN_API, app.mGoogleSignInOptions)
    .addApi(LocationServices.API)
    .build();
// [END build_client]
```

- ❑ Here we build our **GoogleApiClient** specifying the **LocationServices** API.
- ❑ It's common practice to 'rebuild' your api client (can actually improve performance)

MapsFragment – onResume() *

```
@Override  
public void onResume() {  
    super.onResume();  
    getMapAsync(this);  
    CoffeeApi.attachListener(this);  
    CoffeeApi.get("/coffees/" + app.googleToken);  
    if (checkPermission()) {  
        if (app.mCurrentLocation != null) {  
            Toast.makeText(getActivity(), "GPS location was found!", Toast.LENGTH_SHORT).show();  
        } else {  
            Toast.makeText(getActivity(), "No Current location, Set Default Values!",  
                Toast.LENGTH_SHORT).show();  
            app.mCurrentLocation = new Location("Waterford City Default (WIT)");  
            app.mCurrentLocation.setLatitude(52.2462);  
            app.mCurrentLocation.setLongitude(-7.1202);  
        }  
        if (mMap != null) {  
            initCamera(app.mCurrentLocation);  
            mMap.setMyLocationEnabled(true);  
        }  
        startLocationUpdates();  
    }  
    else if (!checkPermission()) {  
        requestPermission();  
    }  
}
```

- Acquire **GoogleMap** (automatically initializes the maps system and the view)
- Get all the coffees to display on map
- Zoom in Camera to current location

MapsFragment – onMapReady() *

```
@Override  
public void onMapReady(GoogleMap googleMap) {  
    mMap = googleMap;  
    mMap.setMapType(MAP_TYPES[curMapTypeIndex]);  
  
    initListeners();  
    if(checkPermission()) {  
        mMap.setMyLocationEnabled(true);  
        initCamera(app.mCurrentLocation);  
    }  
    else if (!checkPermission()) {  
        requestPermission();  
    }  
  
    mMap.getUiSettings().setMapToolbarEnabled(true);  
    mMap.getUiSettings().setCompassEnabled(true);  
    mMap.getUiSettings().setMyLocationButtonEnabled(true);  
    mMap.getUiSettings().setAllGesturesEnabled(true);  
    mMap.setTrafficEnabled(true);  
    mMap.setBuildingsEnabled(true);  
    mMap.getUiSettings().setZoomControlsEnabled(true);  
}
```

- Bind to our **GoogleMap** instance and set its initial type.
- Check for the necessary permissions & zoom
- Request Permissions if not already allowed
- Set the Map (*mMap*) properties

MapsFragment – Permissions *

```
//http://www.journaldev.com/10409/android-handling-runtime-permissions-example
private boolean checkPermission() {
    int result = ContextCompat.checkSelfPermission(getActivity(), ACCESS_FINE_LOCATION);
    int result1 = ContextCompat.checkSelfPermission(getActivity(), CAMERA);

    return result == PackageManager.PERMISSION_GRANTED && result1 == PackageManager.PERMISSION_GRANTED;
}

private void requestPermission() {
    ActivityCompat.requestPermissions(getActivity(), new String[]{ACCESS_FINE_LOCATION, CAMERA},
        PERMISSION_REQUEST_CODE);
}
```

- Checking to see if Location & Camera permissions are allowed
- Requesting Location & Camera permissions

MapsFragment – Permissions *

```
@Override  
public void onRequestPermissionsResult(int requestCode, String permissions[], int[] grantResults) {  
    switch (requestCode) {  
        case PERMISSION_REQUEST_CODE:  
            if (grantResults.length > 0) {  
  
                boolean locationAccepted = grantResults[0] == PackageManager.PERMISSION_GRANTED;  
                boolean cameraAccepted = grantResults[1] == PackageManager.PERMISSION_GRANTED;  
  
                if (locationAccepted && cameraAccepted) {  
                    Snackbar.make(getView(), "Permission Granted, Now you can access location data and camera.",  
                        Snackbar.LENGTH_LONG).show();  
                    if(checkPermission())  
                        mMap.setMyLocationEnabled(true);  
                    startLocationUpdates();  
                }  
                else {  
  
                    Snackbar.make(getView(), "Permission Denied, You cannot access location data and camera.",  
                        Snackbar.LENGTH_LONG).show();  
  
                    if (Build.VERSION.SDK_INT >= Build.VERSION_CODES.M) {  
                        if (shouldShowRequestPermissionRationale(ACCESS_FINE_LOCATION)) {  
                            showMessageOKCancel("You need to allow access to both the permissions",  
                                (dialog, which) -> {  
                                    if (Build.VERSION.SDK_INT >= Build.VERSION_CODES.M) {  
                                        requestPermissions(new String[]{ACCESS_FINE_LOCATION, CAMERA},  
                                            PERMISSION_REQUEST_CODE);  
                                    }  
                                });  
                        }  
                    }  
                }  
            }  
        }  
        break;  
    }  
}
```

- Retrieving permission status
- Updating the User and starting location updates on permission granted

MapsFragment – Tracking Location (1) *

```
public void startLocationUpdates() {  
    try {  
        mFusedLocationClient.requestLocationUpdates(mLocationRequest,  
            mLocationCallback, Looper.myLooper());  
    }  
    catch(SecurityException se) {  
        Toast.makeText(getActivity(),  
            "Check Your Permissions on Location Updates",  
            Toast.LENGTH_SHORT).show();  
    }  
}
```

- ❑ Use the `FusedLocationClient` instance to `requestLocationUpdates`

MapsFragment – Tracking Location (2) *

```
/* Creates a callback for receiving location events.*/
private void createLocationCallback() {
    mLocationCallback = new LocationCallback() {
        @Override
        public void onLocationResult(LocationResult locationResult) {
            super.onLocationResult(locationResult);

            app.mCurrentLocation = locationResult.getLastLocation();
            initCamera(app.mCurrentLocation);
        }
    };
}
```

- ❑ Update our current location (`mCurrentLocation`) and initialise/reposition the camera

MapsFragment – Helper Methods *

```
public void initListeners() {  
    mMap.setOnMarkerClickListener(this);  
    mMap.setOnInfoWindowClickListener(this);  
    mMap.setOnMapClickListener(this);  
}
```

```
private void initCamera(Location location) {  
  
    if (zoom != 13f && zoom != mMap.getCameraPosition().zoom)  
        zoom = mMap.getCameraPosition().zoom;  
  
    CameraPosition position = CameraPosition.builder()  
        .target(new LatLng(location.getLatitude(),  
                           location.getLongitude()))  
        .zoom(zoom)  
        .bearing(0.0f)  
        .tilt(0.0f)  
        .build();  
  
    mMap.animateCamera(CameraUpdateFactory  
        .newCameraPosition(position), null);  
}
```

- Adding necessary listeners to our **GoogleMap** reference.
- Position/reposition the Camera based on current location and set zoom ratio.

MapsFragment – Adding Coffee Markers *

```
@Override  
public void setList(List list) {  
    app.coffeeList = list;  
    addCoffees(app.coffeeList);  
}
```

- ❑ Triggered by our **CoffeeApi** callback
- ❑ Traversing our list of coffees and adding a location marker to the map

```
public void addCoffees(List<Coffee> list){  
    for(Coffee c : list)  
        mMap.addMarker(new MarkerOptions()  
            .position(new LatLng(c.marker.coords.latitude, c.marker.coords.longitude))  
            .title(c.name + " €" + c.price)  
            .snippet(c.shop + " " + c.address)  
            .icon(BitmapDescriptorFactory.fromResource(R.drawable.coffeeicon)));  
}
```

AddFragment – Adding a single Coffee *

- ❑ To demonstrate the true value of using Fragments, we embed our existing **MapsFragment** inside our **AddFragment** (demonstrating even another new(ish) feature in Android)
- ❑ We get all the existing functionality of our custom map, and just need to make a few minor changes to our existing **AddFragment** to allow us to store the location of the coffee as we add it.

AddFragment – Helper Methods *

```
private String getAddressFromLocation( Location location ) {  
    Geocoder geocoder = new Geocoder( getActivity() );  
  
    String strAddress = "";  
    Address address;  
    try {  
        address = geocoder  
            .getFromLocation( location.getLatitude(),  
                location.getLongitude(), 1 )  
            .get( 0 );  
        strAddress = address.getAddressLine(0) +  
            " " + address.getAddressLine(1) +  
            " " + address.getAddressLine(2);  
    }  
    catch (IOException e) {  
    }  
  
    return strAddress;  
}
```

- ❑ Using the **Geocoder** class to extract an address from a location (for storing with the coffee data)

fragment_add *

- Modifying our fragment layout to include another fragment
- Referencing our existing **MapsFragment** fragment

```
<?xml version="1.0" encoding="utf-8"?>
<android.support.constraint.ConstraintLayout
    xmlns:android="http://schemas.android.com/apk/res/android"
    xmlns:app="http://schemas.android.com/apk/res-auto"
    xmlns:tools="http://schemas.android.com/tools"
    android:id="@+id/addLayout"
    android:layout_width="match_parent"
    android:layout_height="match_parent"
    tools:context=".fragments.AddFragment">

    <TextView...>
    <TextView...>
    <TextView...>
    <TextView...>
    <EditText...>
    <EditText...>
    <EditText...>
    <RatingBar...>

    <fragment
        android:id="@+id/addmap"
        android:name="ie.cm.fragments.MapsFragment"
        android:layout_width="364dp"
        android:layout_height="162dp"
        android:layout_marginStart="8dp"
        android:layout_marginTop="8dp"
        android:layout_marginEnd="8dp"
        android:layout_marginBottom="8dp"
        app:layout_constraintBottom_toBottomOf="@+id/addfooter"
        app:layout_constraintEnd_toEndOf="parent"
        app:layout_constraintStart_toStartOf="parent"
        app:layout_constraintTop_toTopOf="parent"
        app:layout_constraintVertical_bias="0.627"
        tools:layout="@layout/activity_map" />

    <Button...>
</android.support.constraint.ConstraintLayout>
```

AddFragment – Initialising/Displaying the Map *

```
@Override  
public void onMapReady(GoogleMap googleMap) {  
    mMap = googleMap;  
    CoffeeApi.get("/coffees/" + app.googleToken);  
}  
  
public void addCoffees(List<Coffee> list)  
{  
    for(Coffee c : list)  
        mMap.addMarker(new MarkerOptions()  
            .position(new LatLng(c.marker.coords.latitude, c.marker.coords.longitude))  
            .title(c.name + " €" + c.price)  
            .snippet(c.shop + " " + c.address)  
            .icon(BitmapDescriptorFactory.fromResource(R.drawable.coffeeicon)));  
}
```

- ❑ Our callback for a map reference and loading the coffees
- ❑ Adding the list of coffees to the map

AddFragment – Adding a single Coffee *

```
public class AddFragment extends Fragment implements  
VolleyListener, OnMapReadyCallback {
```

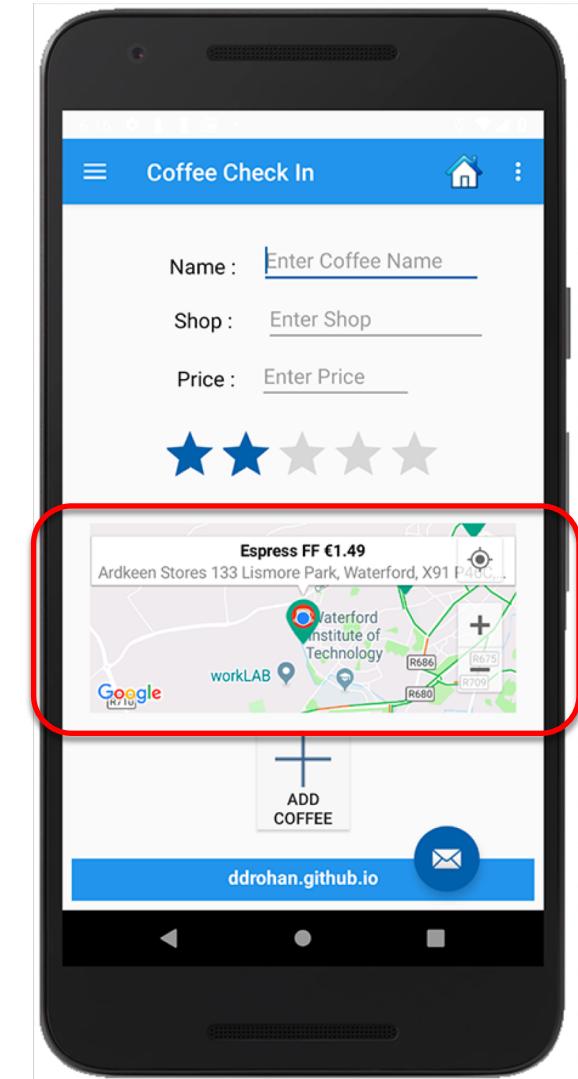

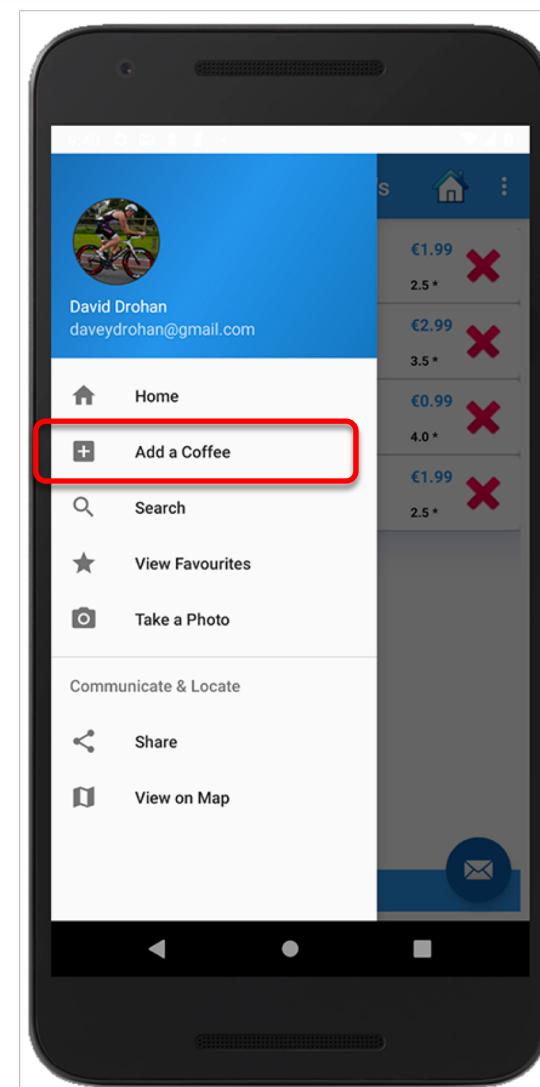

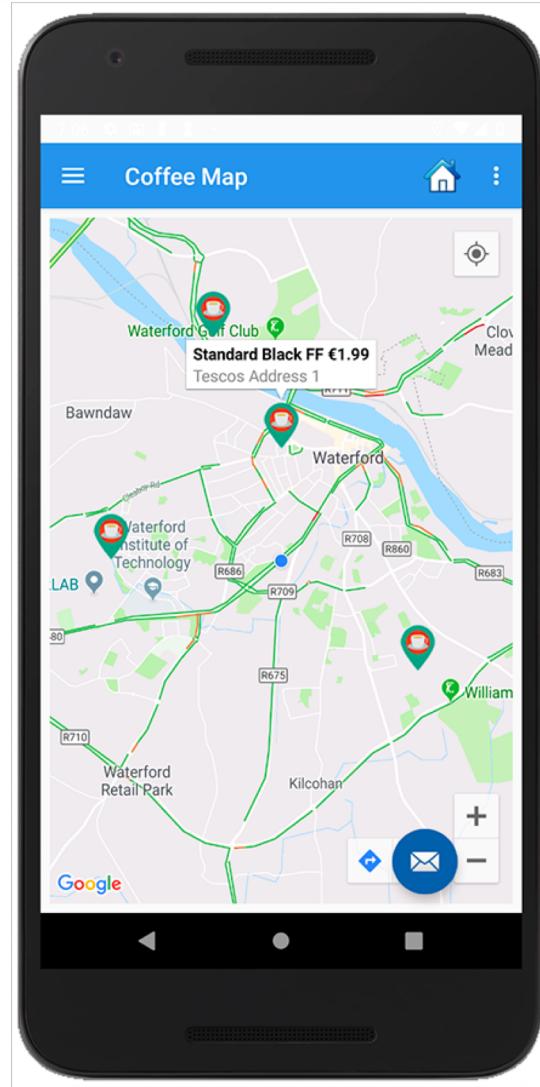

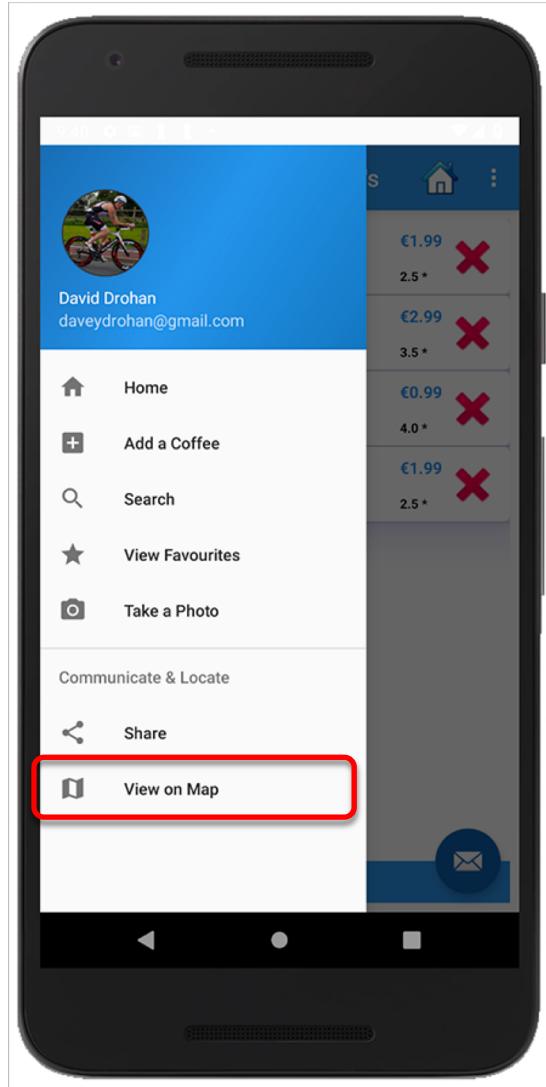

```
if ((coffeeName.length() > 0) && (coffeeShop.length() > 0)  
&& (price.length() > 0)) {  
    Coffee c = new Coffee(coffeeName, coffeeShop, ratingValue,  
    coffeePrice, false, app.googlePhotoURL,  
    app.googleToken, getAddressFromLocation(app.mCurrentLocation),  
    app.mCurrentLocation.getLatitude(),  
    app.mCurrentLocation.getLongitude());  
  
    CoffeeApi.post("/coffees/" + app.googleToken, c);  
    CoffeeApi.get("/coffees/" + app.googleToken);  
    resetFields();
```

```
@Override  
public void setList(List list) {  
    app.coffeeList = list;  
    mMap.clear();  
    addCoffees(app.coffeeList);  
}
```

- ❑ Implement our listeners for relevant callbacks
- ❑ Create a new coffee using the current location, user photo url and full address.
- ❑ Retrieving all our coffees to update the map (triggering the callback)
- ❑ Our Callback, refreshing the map with a newly added coffee

CoffeeMate 8.0 *

Summary

- ❑ Overview
- ❑ Installation & Registration of the Google Maps API ‘Key’
- ❑ Creating interactive Maps with **GoogleMaps**,
(Support)MapFragments & **FragmentActivitiy**s
- ❑ Creating & Adding **Markers** to Maps
- ❑ Custom Styling our Maps (Video)
- ❑ And how we did it a lot of it in CoffeeMate ☺

Questions?

Thanks!

A black and white cartoon illustration of a hand with three fingers pointing towards a smiling sun. The sun has a face with two dots for eyes and a wide smile. It is surrounded by simple clouds. The drawing is done in a sketchy, hand-drawn style.
